

Fenceline Newt Barrier Film

Fenceline Newt Barrier film is designed for the construction of physical barriers to protect and contain naturally occurring populations of endangered amphibian species. Barriers against these species are very important during and sometimes after civil engineering projects such as pipeline construction and road building.

The Great Crested Newt and Natter Jack Toad are protected under the Wildlife and Countryside Act 1981 and Habitats Regulations Act of 1994. In addition adders, grass snakes, slow worms and common lizards are also protected under the Wildlife and Countryside Act of 1981 which protects them from injury, killing and sale.

Fenceline newt barrier film is supplied in 100m rolls 1m wide and is UV light stabilised. The film is manufactured specially from prime grade polymer ensuring the finished film is of the highest quality with a smooth surface that resists climbing. The film is green tinted and is 100% free of blemishes. This is a tough heavy grade film.

Drop trap plastic buckets are also available to compliment the newt barrier fence.
